retribution-theory, *s.*

Anthrop.: The term used to signify the belief in different grades of future happiness, especially in different regions of the other world, allotted to men according to their lives in this. It is very far from being universal. Tylor (*Prim. Cult.*, ch. xiii.) considers that at first the doctrine of a future life was that such life was a mere continuance of the present, and this he calls the Continuance-theory; that the belief passed through an intermediate stage, in which it was held that excellence, valour, social rank, and religious observance modified circumstances and surroundings in the next life, and was finally developed into a doctrine of future reward and punishment.

"On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance-theory and the *retribution-theory*."—*Tylor: Prim. Cult.*, ch. xiii.

retributive-theory, *s.*

Law: The theory that punishment is inflicted in retribution for an offence, and should if possible be similar in character to the misdeed which it punishes. It was acted on in the early legislation of all countries. Its principle was, "An eye for an eye, and a tooth for a tooth" (Exod. xxi. 24). It has been displaced by the view that no more punishment should be inflicted by human law than is sufficient to deter others from committing the offence. Even capital punishment is not defended on the principle that "Life shall go for life" (cf. Deut. xix. 21), but because it is believed that with abandoned criminals of a certain type it has a more deterrent effect than penal servitude for life would possess.

¶ *The Revelation of St. John the Divine:*

New Test. Canon: The last book of the New Testament, and the only distinctively prophetic one given to fling back the veil [Etym.] which hides futurity from the view. Its writer was John (i. 4, xxii. 8), the servant of God (i. 1), the "brother" and "companion in tribulation" of the then persecuted Christians, himself an exile in Patmos, "for the word of God and for the testimony of Jesus Christ" (i. 9). It was there he saw the prophetic visions, narrating them after he left the island. The majority of the Fathers and the Church of the Middle Ages, considered, as do most modern Christians, that the author was John the Apostle; though Dionysius of Alexandria, and some others among the ancients, believed him to have been a certain John the Presbyter (mentioned by Papias, Dionysius, Eusebius, and Jerome) whose tomb, like that of the apostle, was said to be at Ephesus. Finally, Beza hinted, and Hitzig more confidently asserted, that the work emanated from John Mark, author of the second gospel, with whose style that of the Revelation was said partly to agree. Many modern critics have rejected the hypothesis that John the Apostle was the author of the Revelation, stating that the Greek of the latter book is deeply tinged with Hebraisms, while that of the gospel is much more classic. Among those who accept the apostolic authorship of the work, two views are current as to its date. The prevailing one is, that the visions in Patmos were seen in A.D. 96, and the work penned in that year or in 97, the reigning emperor being Domitian. The other view is, that it was penned about A.D. 68 or 69. Ch. xvii. 10 is interpreted to mean that five Roman emperors had reigned and died, viz., Augustus, Tiberius, Caligula, Claudius, Nero, "one is," *i.e.*, Galba, or if Julius Cæsar be considered the first emperor, then the "one" is Nero. Respecting the canonicity of this book, it was alluded to or quoted in Hermas, Papias, Melito, Justin Martyr, the fragment published by Muratori, Theophilus of Antioch, Apollonius of Ephesus, Irenæus, Hippolytus, Tertullian, Clement of Alexandria, Origen, Jerome, &c. It was not in the Old Syrian version, though some Greeks accepted it. The Corinthians, Caius of Rome, and others rejected it. Luther, Carlstadt, and Zwingli spoke of it disparagingly, but it is accepted by the Churches of the Reformation, as well as by the Roman Church. The "Son of Man (i. 13), who died and lives again for evermore, and has the keys of hell and death" (17, 18), appears in the first vision, and commissions the apostle to write to the seven churches of Asia (ii., iii.). A manifestation of the divine glory is seen (iv.), and the "Lamb who was slain," "the Lion of the tribe of Judah," having opened a book with seven seals, seven visions corresponding to the

seven seals are witnessed (vi.). To the seals succeed seven trumpets (viii., ix.), afterwards a woman persecuted by a dragon (xii.), and two beasts, which rise, one from the sea the other from the earth, are exhibited (xiii.). Those sealed by the Lamb appear in blessedness (xiv.), seven vials of wrath are poured out (xv., xvi.), the mystic Babylon is destroyed (xvii.–xix.), millennial glory follows (xx. 1–6), and after a brief apostasy (7–10), the last judgment takes place (11–15), the New Jerusalem descends (xxi.), and unalloyed felicity arises to those who have been faithful to the end (xxii.). Three schemes of interpretation exist: the Preterist, which makes the events predicted now wholly passed, the Futurist, which regards them as future, and that of a third and numerous school, who regard the visions as an historical or continuous prediction of the whole history of the Church from apostolic times to the consummation of all things.

Revised Version, *s.*

Bible: A revised edition of the Authorized Version of the Bible. The resolution to undertake it was come to by the Convocation of Canterbury in Feb. and May, 1870, and various members were nominated to carry out the work. Cooperation was sought from scholars in other churches, and from an American committee. A better text was constructed, manuscripts being used which bad been discovered since the Authorized Version had been made. Revision, not retranslation, was aimed at, as few alterations as possible being introduced, and these only if adopted by the

votes of two-thirds of the translators. It follows that a new rendering might commend itself to the majority of them, and yet be relegated to the margin, while that which had only a minority of votes was left in the text. The headings of chapters and pages, paragraphs, italics, and punctuation were to be revised, and finally the headings were omitted. Poetry was printed in lines, showing the rhythm. The New Testament was published in May, 1881, the Old in May, 1885. Each had an immediate and large sale, but the Authorized Version still holds its place in most churches and chapels.

6. A restoration or renewal of validity, force, or effect: as, the *revival* of a debt barred by the statute of limitations, &c.

7. The reproduction, as of a play at a theatre, after a lapse of time.

II. *Comparative Religions:*

1. *Gen.:* Revivals occur in all religions. When one takes place a large number of persons who have been comparatively dead or indifferent to spiritual considerations, simultaneously or in quick succession become alive to their importance, alter spiritually and morally, and act with exceeding zeal in converting others to their views. A Muhammadan revival takes the form of a return to the strict doctrines of the Koran, and a desire to propagate them by the sword. A Christian minority living in the place is in danger of being massacred by the revivalists.

2. *Christian Revivals:* Pentecostal effusion of the Holy Spirit (Acts ii.) produced a revival within the infant church, followed by numerous conversions from outside. Revivals, though not called by that name, occurred at intervals from apostolic times till the Reformation, the revivalists being sometimes so unsympathetically treated that they left the Church and formed sects, while in other cases, and notably in those of the founders of the monastic orders, they were retained and acted on the Church as a whole. The spiritual impulse which led to the Reformation, and the antagonistic one which produced or attended the rise of the Society of Jesus, were both revivalist. It is, however, to sudden increase of spiritual activity within the Protestant churches of the English-speaking peoples that the term revival is chiefly confined. There were revivals in Scotland at Stewarton (1625–30), at Shotts (1630), and at Cambuslang and Kilsyth (1742). The enterprise of the Wesleys and of Whitefield in England from 1738 onward was thoroughly revivalist. There were revivals at Northampton, in Massachusetts, in 1734, and throughout New England in 1740-1, the Rev. Jonathan Edwards being the chief instrument in their production. A great one arose in America in 1857, after the financial crisis of that year. It spread in 1859 to Ulster, and in 1864 to Scotland and to parts of England. Since then various revivals have from time to time occurred, and nearly all denominations aim at their production. The means adopted are prayer for the Holy Spirit, meetings continued night after night, often to a late hour, stirring addresses, chiefly from revivalist laymen, and after-meetings to deal with those impressed. Ultimately, it is found that some of those apparently converted have been steadfast, others have fallen back, whilst deadness proportioned to the previous excitement temporarily prevails. Sometimes excitable persons at revival meetings utter piercing cries, or even fall prostrate. These morbid manifestations are now discouraged, and have in consequence become more rare.

"*Revivals* have become necessary to the advance of Christianity, simply because of the incompetency of the ordinary preaching; and the moment the *revivals* come, the preaching changes, or it changes before they come."—*Scribner's Magazine*, June, 1877, p. 256.

rhĕt'-ôr-ĭc, * **ret-or-ike,** * **rhet-or-ick,** *s.* [Fr. *rhétorique*, from Lat. *rhetorica* (*ars*) = (the art) of rhetoric, from Gr. *ῥητορική* (*τέχνη*) (*rhētorikē*) (*technē*)), from *ῥήτωρ* (*rhētōr*) = an orator; Sp. & Ital. *retorica.*]

1. Originally, the art of speaking effectively in public, but afterwards the meaning was so extended as to comprehend the theory of eloquence, whether spoken or written. The first treatise on rhetoric, that of Aristotle (B.C. 384-322), is marked by great acuteness and is still valuable. He considered Rhetoric as a branch of Logic. The chief elements of an oration may be comprised under (1) Invention, or the character of the ideas to be employed; (2) Disposition, or their arrangement; and (3) Elocution and (4) Delivery, both of which have respect to words, style, utterance, action, &c. The rhetorical points and accents are said to have been introduced by Aristophanes of Byzantium, about 200 B.C. The art was taught at Rome by Photius Gallus about 87 B.C. Quinctilian, after teaching rhetoric for twenty years, published in the reign of Domitian, his *Institutio oratoris*, the education of an orator. In 1776 Principal Campbell published a work on the

Philosophy of Rhetoric, and, in the year 1826, Archbishop Whately issued his *Elements of Rhetoric*. Campbell (*Phil. of Rhetoric*, bk. i., ch. i.) considers the art the same as eloquence, and defines it as "That art or talent by which the discourse is adapted to its end," and states that the ends of speaking (or writing) are reducible to four, to enlighten the understanding, to please the imagination, to move the passions, or to influence the will. Broadly speaking, the aim of rhetoric is to expound the rules governing prose composition, or speech designed to influence the judgment or the feelings. It includes, therefore, within its province, accuracy of expression, the structure of periods, and figures of speech.

2. The art which teaches oratory; the rules which govern the art of speaking with propriety, elegance, and force.

3. Rhetoric exhibited in language; artificial eloquence, as opposed to natural or real eloquence; declamation; showy oratory.

rheû'-mą-tĭzm, *s.* [Lat. *rheumatismus*; Gr. *ῥευματισμός* (*rheumatismos*), from *ῥεῦμα* (*rheuma*).] [RHEUMA (1).]

Pathol.: Acute articular rheumatism or rheumatic fever is produced by the presence in the blood of a poisonous material (probably lactic acid in excess), generated within the system by some derangement of the nutritive and elementary processes. The ordinary causes are exposure to cold and damp, sudden chill, sitting in wet clothes or in a cold draught, and scarlatina also sometimes produces it in children. It is a distinctly hereditary disease, chiefly attacking persons from fifteen to thirty-five years of age, but no time of life is exempt. Affections of the heart are present in most acute cases, particularly pericarditis, with the blowing, bellows-like murmur so characteristic of this complication, and this is apt to be permanent. It is usual for many attacks to follow through life, and in the young chorea, or St. Vitus's dance, is a common sequent. The joints become swollen, red, hot, and painful even to agony. Relief of pain and alkalinity of the blood are the most necessary indications for the successful treatment of rheumatism. It frequently becomes chronic, and assumes other forms as well as the articular, or rheumatism of the joints, such as myalgia, or muscular rheumatism, wry-neck, lumbago, gonorrhœal rheumatism, and *Arthritis deformans*, in which deformity and twisting of the joints is the most prominent characteristic.

1. *Zoology:*

(1) The sole recent genus of the family Rhinocerotidæ (q.v.). It falls naturally into three sections, which some zoologists raise to the rank of genera.

(*a*) *Rhinoceros:* Adults with a single large compressed incisor above on each side, occasionally a small lateral one, below a very small median, and a very large procumbent, pointed, lateral incisor; nasal bone pointed in front; single nasal horn; skin very thick, and raised into strong, definitely-arranged folds. There are two well-marked species: (1) *Rhinoceros unicornis* (Linnæus; *indicus*, Cuvier), now found wild only in the terai region of Nepal and Bhotan and in Assam, though it had formerly a much wider geographical range; (2) *R. sondaicus* (or *javanus*, Cuvier), the Javan Rhinoceros, is smaller, and distinguished by the different arrangement of the folds of the skin, and by the small size or absence of the horn in the female. Found near Calcutta, in Burmah, Malay Peninsula, Java, Sumatra, and probably Borneo. *R. unicornis* was known to the ancients, and was seen probably for the first time by modern Europeans when one was sent to the king of Portugal from India in 1513.

(*b*) *Ceratorhinus:* The folds are not so strongly marked as in the first section. There is a well-developed nasal, and a small frontal horn, separated by an interval. The name, *R. sumatrensis* has possibly been applied to more than one species, and two animals in the Zoological Gardens, Regent's Park, presented considerable differences of form and colour. Dr. Sclater named one of them *R. lasiotis*, the Hairy-Eared Rhinoceros. Geographical range nearly the same as that of the Javan Rhinoceros, but it does extend into Bengal.

(*c*) *Atelodus*, with two well-marked species, peculiar to Africa. Incisors rudimentary or wanting, well-developed anterior and posterior horns in close contact; skin without definite permaneut folds. *R. bicornis*, the Common Two-horned Rhinoceros, is the smaller, and has a pointed prehensile lip. It ranges from Abyssinia to Cape Colony, but the progress of civilization and the attacks of English sportsmen are rapidly reducing its numbers. Two varieties are said to exist, *R. bicornis major* and *R. bicornis minor*. Specimens in which the posterior horn has attained a length as great as or greater than the anterior have also been separated under the specific name of *R. keitloa* [KEITLOA], but with scarcely sufficient reason. *R. simus*, Burchell's, the Square-mouthed, or White Rhinoceros, has a square truncated lip, browses on grasses, and frequents open country. It is the largest of the family, an adult male standing over six feet at the shoulder. The epithet White is a misnomer, for the animal is a dingy slate-colour. A local variety in which the horn has a forward rake is sometimes described as *R. oswellii.*

(2) Any individual of the genus Rhinoceros [(1)]. The rhinoceros is the largest and most powerful terrestrial mammal, except the elephant, to which, as well as to the hippopotamus and tapir, it is allied. They are of low intelligence, and usually harmless, but when provoked they display considerable ferocity, and, though apparently so clumsily formed, can run with great speed. Only one is produced at a birth. The flesh is sometimes used for food; in the East Indies, the skin, which is said to be bullet-proof at short distances, is used for shields, and in South Africa it is made into whips.

2. *Palæont.: R. pachygnathus*, from the Miocene of Greece, was apparently intermediate between *R. bicornis* and *R. simus*. Four species, all bicorn, formerly inhabited Britain: *R. tichorhinus*, the Woolly Rhinoceros (q.v.), from the Brick-earths of the Thames Valley, *R. hemitœchus* (Falc., *leptorhinus*, Owen), *R. megarhinus* (*leptorhinus*, Cuvier & Falc.) and *R. etruscus*, of Pliocene age. The one-horned Indian type was well represented (*R. sivalensis, R. palæindicus*) in the Pleistocene of the sub-Himalayan region. *R. schleirmacheri*, of the late European Miocenes, possessed incisors and was bicorn.

rhō'-dĭ-ŭm, *s.* [Latinised from Gr. *ῥόδον* (*rhodon*) = a rose, from the red colour of some of its salts.]

Chem.: A tetratomic metallic element belonging to the platinum group, symbol Rh; atomic weight, 104·4; sp. gr. 10·6 to 12; discovered by Wollaston in 1804 in crude platinum. To obtain it, the solution from which platinum, palladium, and iridium have been separated is mixed with hydrochloric acid, evaporated to dryness, and the residue treated with alcohol of sp. gr. 0·837, which dissolves everything except the double chlorides of rhodium aud sodium. On filtering, heating the residue to dryness, and boiling with water, metallic rhodium remains. It is a whitish-gray metal, very hard, less fusible and less ductile than platinum, unalterable iu the air at ordinary temperatures, but oxidising at a red heat. When pure it is unacted upon by the strongest acids, but when alloyed it dissolves in nitro-hydrochloric acid. Rhodium forms but one chloride, $RhCl_3$, a brownish-red deliquescent mass, soluble in water. It forms four oxides: monoxide, RhO, a dark-gray substance, unattacked by acids; sesquioxide or rhodic oxide, Rh_2O_3, a gray porous mass, with a metallic iridescence; dioxide, RhO_2, a dark-brown substance; and trioxide, RhO_3, a blue flocculent powder, all insoluble in acids. The salts of rhodium are for the most part rose-coloured.

rhodizonic-acid, *s.*

Chem.: A uame applied to two distiuct compounds, produced under different circumstances from potassium carboxide. α-Rhodizouic acid, $C_5H_4O_6 = (C_5HO_3)'''_{H_3}\}O_3$, discovered by Heller in 1837, is formed from carboxylic acid by the assumption of water, $C_{10}H_4O_{10} + 2H_2O = 2C_5H_4O_6$. It crystallizes in colourless rhombic prisms, easily soluble in water and alcohol. On exposure to the air the crystals turn brownish-red, heated to 100° they turn black, at a higher temperature they decompose, leaving a carbonaceous residue. The α-rhodizonates, produced from the hydro-carboxylates, are all red, and very iusoluble. β-Rhodizonic acid, $C_{10}H_6O_8$. This acid is unknown in the free state, but its potassium salt, $C_{10}K_6O_8$, discovered by Brodie in 1859, remains undissolved when potassium carboxide is treated with absolute alcohol. It is distinguished from α-rhodizonate by the rapidity with which it absorbs oxygen on exposure to air and moisture, being converted iuto potassium crocouate.

Calyx small, persistent, five-partite; petals five; stamens five; ovary one-celled, sessile; fruit a dry drupe, with one exalbuminous seed. Nearly a hundred species are known. 1. The measure of time or movement by regularly recurring motions, impulses, sounds, &c., as in poetry, prose, and music, and, by analogy, in dancing; periodical emphasis; numerical proportion or harmony. In poetry rhythm is the regular succession of arses and theses, or of long and short (heavy and light) syllables in a verse. In prose it is an arrangement of words in an expressive and pleasing succession; but its regularity is not so great that it can be reduced to a law. When it can be reduced to a law, it loses the name of *rhythm* and becomes *metre.* In music rhythm is the disposition of the notes of a composition in respect of time and measure; the measured beat which marks the character and expression of the music. In dancing, the rhythm is recognised in the sound of the feet.

"When we talk or write continuously about any subject that appeals to the passions, we gratify a natural instinct by falling into a certain regularity. Both the voice and the arrangement of the words fall under this regular influence: the voice is modulated, and the words are regulated in a kind of flow called *rhythm.* Without *rhythm*, the expression of passion becomes spasmodic and painful, like the sobbing of a child. *Rhythm* averts this pain by giving a sense of order controlling and directing passion. Hence *rhythm* is in place wherever speech is impassioned, and intended at the same time to be pleasurable: and impassioned speech without *rhythm* is, when long continued, unpleasing."—*Abbott & Seeley: Eng. Lessons for Eng. People*, § 91.

2. Rhyme, metre, verse, number.

3. *Physiol.:* The proportion as to time between the action of an organ, an intermittent or remittent disease, &c., at successive periods. It was discovered by Steller, a German naturalist in the Russian service, in 1741, and was then extremely abundant round Behring's and Copper Island in the North Pacific. The last was supposed to have been killed in 1768, but "Nordenskiöld obtained information from the natives of Behring's Island which led him to believe that a few individuals may have survived to a much later date, even to 1854" (*Encyc. Brit.* (ed. 9th), xv. 391. Note). The habits of the Rhytina were similar to those of the Manatee, which it greatly exceeded in size, attaining a length of about twenty-five feet. Steller published an excellent account of its anatomy and habits, and quantities of its remains have since been discovered. A nearly perfect skeleton from Behring's Island has been placed in the Natural History Museum, South Kensington.

It probably supports a larger number of the human race than any other cereal, or indeed than any other plant. It contains 85 per cent. of starch, and is considered less nutritious than wheat. Professor Watt says that the husked seeds and the flour are demulcent and diuretic. In India they are sometimes used in diseases of the urinary organs and in catarrh, also as an external application to burns and scalds.

Bot.: A genus of Crotoneæ. It is largely cultivated all over the warmer countries. In Europe it becomes an annual. Fifteen or sixteen varieties of the plant have arisen. Prof. Watt (*Calcutta Exhib. Rep.*, iv. 60) reduces them to three sections: (1) small-seeded, (2) large-seeded, (3) a form grown, on account of its leaves, as food for the Eria silkworm. The small-seeded form is grown as a crop, the large-seeded one as a hedge. The seeds furnish castor oil, and are also used by dyers to render colours permanent. Persons camping near a field of the plant are apt to be attacked with diarrhœa. The fresh juice is used as an emetic; made into a poultice with barley-meal it is used in inflammation of the eye. The leaves as a decoction, or as a poultice, are lactagogues and emmenagogues.

1. The term applied to any musket or gun-barrel which is grooved so that the projectile may have a rotatory motion on its own axis. The rifling may be polygroove as in the Armstrong and other guns, with only two grooves as in some of the early weapons, with the two grooves with the angles rounded away so as to produce an oval and yet twisted bore as in the Lancaster guns, or with three or more grooves as in most modern weapons. The grooves are of varying size, form, and width, and of different degrees of twist in the length of the barrel itself, that of the Henry rifling being one turn in twenty-two calibres or widths of the bore. The bullet is made to fit the bore either by expansion of the base of the lead bullet, or, as in the early pattern, by having the ball "belted," so that the belt should take the groove and so emerge from the muzzle with a rotatory motion. The utility of the *Magazine rifle*, a firearm having attached to it a magazine or case containing four or more cartridges capable of being fed successively into the barrel, was first demonstrated in the United States Civil War, in which it was brought to some extent into use. It was still more fully demonstrated in 1877 when the Turks, armed with Winchester repeating rifles, constantly repulsed the Russian assaults on the works before Plevna. The Springfield rifle, formerly used by the United States army, was supplanted by the Winchester and other small-bore repeaters, and these are now giving place to the new Krag-Jorgensen rifle, also a repeater of small calibre, which throws a pencil-shaped steel projectile a distance of from three to five miles. The European nations have generally adopted magazine rifles.

1. A correspondence of sound in the final syllable or syllables of two or more words; especially the correspondence in sound of the final syllable or word of one line of poetry with the final syllable or word of another. Three things are essential to a perfect rime:—

(1) Identity in the vowel sound, and, if the words end in a consonant, in the consonants also, as in *try* and *cry, sight* and *light.* Identity of letters is not enough, the identity must be one of sound; thus, *close* and *lose, heath* and *death* are not rimes.

(2) Difference in the consonants preceding the vowel, as *way* and *lay, find* and *mind.*

(3) Similarity of accent, as *sing* and *fling; singing* and *fling* would not be good rimes.

¶ Words like *oar* and *o'er, eye* and *I,* are assonances [Assonance]. Rimes in which the final syllables alone correspond are called single or masculine (male) rimes, as *band, hand;* those in which the two final syllables correspond, the first being accented, are called double or feminine (female) rimes, as *crying, trying.* Triple rimes extend over three syllables, as *scrutiny, mutiny; dutiful, beautiful.*

2. *Fig.:* A large and abundant stream; a copious flow.

"*Rivers* of water run down mine eyes, because they keep not thy law."—*Psalm* cxix. 136.

II. *Technically:*

1. *Geog.:* A large stream of water flowing over a certain portion of the earth's surface, and discharging itself into the sea, a lake, a marsh, or another river. A river is generally a stream of considerable size formed by the union of several brooks, streams, or rivulets. When several streams join, so as to produce a river of considerable size, this last is called the principal river, and the minor rivers of which it is composed are called its tributaries, affluents, branches, or feeders. The district drained by such a system of streams or rivers is termed a river-basin (q.v.). Rivers generally have their sources in springs, or from the gradual melting of the snow and ice which perpetually cover the summits of the most elevated ranges of mountains. The channel or cavity in which a river flows is called its bed, and the solid land which borders the bed is its banks. The termination of the course of a river, or where it discharges itself into the sea, another river, &c., is called its mouth.

The following table shows the length and area of some of the principal rivers:—

	Length in miles.	*Area of Basin. Sq. miles.*
Mississippi, with Missouri	4,100	1,290,000
Nile	3,700	1,290,000
Amazon	3,400	2,330,000
Obi	3,200	1,190,000
Yang-tse-kiang	3,200	689,000
Yenesei	3,200	880,000
Lena	2,900	942,000
Amur	2,800	403,000
Congo	2,600	1,540,000
Niger	2,600	1,060,000

Darwin (*Descent of Man,* pt. i., ch. vi.) considered rivers as harbours of refuge for certain fishes, and as standing to the ocean in the same relation as islands do to continents.

2. *Geol.:* Rivers may in some cases be aided in hollowing out their beds by existing ravines and fissures, in others their whole channel is scooped out by themselves. The most rapid movement of the water is at the surface, friction retarding the lower and lateral currents. A velocity of three inches per second at the bottom is sufficient to tear up fine clay, six inches per second fine sand, twelve inches per second fine gravel, and three feet per second stones as large as an egg. Hence the transporting power of a river is enormous, especially when in flood. The material carried forward is deposited in the estuary at the mouth of the stream, and tends to form a delta (q.v.). Rivers have existed in all geological periods; one is traceable in the Carboniferous rocks of the Forest of Dean.

3. *Law:* Rivers are distinguished as navigable and non-navigable: the former being the property of the state, and subject to state jurisdiction; the latter the property of those through whose lands they flow. Improvements in many of our inland navigable rivers, by means of dams and locks, are now being made by the Government at public expense. The Ohio and some of its tributaries have been greatly improved by this method during the last few years.

Compar. Religions: An expression frequently met with in anthropological writings, and derived from the fact that, in very many forms of religion, the passage from the present to another state of existence is thought to be effected by the actual crossing of a river. The belief existed in classical times (cf. *Virg. Æn.* vi. 134, 145, with *Od. μ.* 22), and is very widely spread among races of low culture in the present day (*Tylor: Prim. Cult.,* cb. xii., xiii.). When used for joining pieces of leather, as in making belting, an annular disc, termed a burr, is placed over this end previous to swaging, in order to give a greater bearing. Rivets are cut from round metal rods, and formed by special machinery. In riveting iron plates together, as in boilers, tanks, &c., the rivet is made red-hot, and while a sledge is held against the head, the end is swaged down by striking directly with a riveting-hammer, or a species of die called a snap-head is interposed. In riveting together wooden surfaces, they may be lined with metallic plate, or washers may be placed under the head and the swaged burr, to prevent the indentation of the wood.

It is well known that the clergy and bishops were required formerly by the decrees of Synods to wear their albes constantly; hence the *rochets,* which were merely reduced albes, were introduced from reasons of commodity . . . II. *Geol.:* Any portion of the earth's crust, coherent or incoherent, any sedimentary stratum or any dyke or overlying mass of volcanic or plutonic mineral matter. The older writers drew a distinction between rocks and soils. Both are now regarded as rocks. So are blown sand, silt, mould, and peat; though the last is soft, spongy, and of vegetable origin. Were the vegetable character to exclude it, coal would have to be omitted too. Most rocks, originally soft, have become hard and compact by losing their moisture, and being subjected to pressure. As a rule a rock is not a bed of some simple mineral. In most cases there are crystals cemented together by imperfectly crystalline or amorphous matter, or there is a mixture of angular and rounded grains, also bound together by mineral matter. [Mineral.] Viewed as to composition, there are three leading classes of rock: Siliceous or Arenaceous, some formed of loose sand, others of hard sandstone, with all intermediate grades; Argillaceous rocks, *i.e.* rocks of clay, or more specifically having one-fourth alumina to three-fourths silica; and Calcareous rocks composed chiefly of carbonate of lime, some of them proved, and most of the others suspected, to be originally composed of various organisms. Viewed as to their origin, Lyell long recognized four kind of rocks: Aqueous or Sedimentary, Volcanic, Metamorphic, and Plutonic (all which see). A fifth category has now been superadded, viz., Aërial or Æolian, formed by the action of wind. Aqueous, Æolian, and Metamorphic rocks are, as a rule, stratified; Volcanic and Plutonic rocks generally unstratified: the last two are called igneous. Some stratified rocks are unfossiliferous, others fossiliferous. For the stratigraphical or chronological order of the latter, see Fossiliferous. Much light has recently been thrown on the composition and origin of rocks, by subjecting thin sections of them to microscopic examination. [Geology.]

Roent'-gĕn's method, *s.* [After Wilhelm Conrad Roentgeu, Professor of Physics at the University of Wurzburg, Germany.]

Roentgen rays, *s.*

Photog.: A hitherto unknown manifestation of force or energy, recently discovered by Professor Roentgeu, reported by him to the Medico-Physical Society of Wurzburg on December 4, 1895, and since verified by numerous investigators throughout the scieutific world. This manifestation is a result of the action of the secondary electric or induction current upon highly exhausted vacuum tubes, and is entirely distiuct from the so-called "cathode rays" produced by this current within snch tubes and first described by Crookes as "radiant matter" and more lately and fully studied by Hirtoff, Hertz and Lenard.

The most notable quality of the Roentgen rays—or, as he terms them, of the X-rays—is the ability to peuetrate considerable thicknesses of substances heretofore considered opaque to all known forms of light, besides which they are also capable, either before or after such penetration, of acting actinically upon ordiuary photographic plates and of producing fluoresceuce in certain chemical compounds. And, as the permeability of various substauces to tbese rays depends largely, though not altogether, upon their respective deusities, it is therefore possible to make upon sensitive photographic plates outline- or shadow-pictures of objects entirely hidden from uormal sight, or to render these visible by interposing a fluorescent screen between them and the eye. Thus shadowgraphs or skiagraphs have been made of metal articles enclosed in wooden boxes, of coins, &c. in purses, of the bones in the living body, &c. (see illustrations), and by means of the skiascope these same objects become immediately visible to the observer.

It is interesting to note the degree of transpareucy of various common substances. Cork and paper are very transparent; so is water and several other fluids, bnt not so much so as cork. Wood, ebonite, vulcanite aud animal flesh are readily penetrated and for considerable tbicknesses; one observer has secured good results thorough eight inches of wood and Nikola Tesla has recently obtained a good skiagraph of the ribs, clavicle, scapula, &c. of tbe living adult. Of the metals, Roentgen reports platinum as the most opaque and alumiuium the most transparent of those examined; the latter being about 200 times more permeable than the former. Lead is three and zinc six times as permeable as platiuum. Salts of metals are about as transparent as their respective metals. Glass is comparatively opaque to the rays, having about the same degree of permeability as alumiuium. The true nature of the rays is still uncertain and tbe subject of much discussion. It is knowu that they pass in straight lines and apparently have their origin on the surface, aud not within the vacuum (Crookes') tubes from which they emanate. They are perfectly invisible to the human eye, aud ouly manifest their results, so far as we now know, by producing fluorescence or by acting on photographic emulsions. Inasmuch as ultra-violet light has the power of producing fluorescence and of penetrating to a degree certain substances ordinarily considered opaque, some have thought that the Roentgen rays are similar in nature to light. But Roentgen himself did not think that this could be so, inasmuch as he was unable to refract, reflect or polarize the rays by any methods he was able to employ, and he suggests the possibility of their being due to longitudinal instead of the transverse vibrations in the ether—an entirely new form of force-transmission. However, Tesla has very recently succeeded in deflecting the rays by ueans of zinc and other metals, aud it is possible that they still may be fouud to obey the laws of ordiuary light and to be due to trausverse ether vibrations of peculiar wave length and frequency. It is also as yet unknown whether they have any other source than the vacuum or Crookes' tubes, bnt the writer and others have succeeded in obtaining skiagraphs and other photographic effects by meaus of sunlight and by artificial light through aluminium plates one millimeter in thickness, as well as through vulcauite and other opaque substances. The immediate future will doubtless be prolific of much information concerning this new and wonderful discovery. (*Seneca Egbert, M.D., April 10, 1896.*)

The iron is passed through each in succession, being thus gradually reduced in size and increased in length. ¶ *The Epistle of Paul the Apostle to the Romans:*

New Test. Canon: The first in arrangement (not in date) of St. Paul's Epistles. It was written from Corinth (cf. xvi. 23 with 1 Cor. i. 14; 2 Tim. iv. 20) on his third missionary journey, apparently in the spring of A.D. 58, a year after the First, and half a year after the Second Epistle to the Corinthians, and a few months after the Epistle to the Galatians (cf. Rom. xv. 25, 26 with Acts xix. 21, xx. 1–3, xxi. 15). In writing it he employed an amanuensis, Tertius (Rom. xvi. 22), and sent it by the hand of Phebe, a servant to the church at Cenchrea, the port of Corinth (verse 1). When Paul penned it he had never been to Rome (Acts xix. 21; Rom. i. 10–13, &c.), and had not, therefore, directly founded its church. Among those present on the day of Pentecost, there were "strangers of Rome, Jews, and proselytes" (Acts ii. 10). If, as is possible, some of them returned home after seeing the miracle, and listening to the impassioned preaching of St. Peter, they may have been the first to sow the seeds of Christianity in the metropolis, and Peter have been the indirect founder of the Roman Church. The tradition that he founded it more directly, A.D. 41, originated with Jerome, who died A.D. 420, and is difficult to reconcile with Acts xv. 7–11, and Gal. ii. 1–9. It is remarkable that St. Paul makes no allusion in his epistle to any pastor of the Roman Church, as if it had not been organized under ecclesiastical officers. The Church seems to have been partly Jewish (ii. 14–17, vii. 1), and partly Gentile (i. 6, 13, xi. 13). The epistle opens with an introduction in which Paul declares his apostleship (i. 1–7), commends the faith of the Roman Christians, whom he earnestly desires to visit (8–13), proclaims that he is not ashamed of the gospel of Christ (14–17), and then glides almost insensibly into the most systematic treatment of Christian doctrine and practice to be found in the New Testament. Trying the Roman and other parts of the Gentile world by the light of nature (19–20), he shows how fearfully corrupt the heathens then were, and how destitute of excuse for their conduct (18–32). The Jew is next shown to have flagrantly violated the Divine law revealed to him, and it is proclaimed that all the world stands guilty before God (ii., iii. 1–19). Justification is in no case to be obtained by the "deeds of the law" (20), but is granted freely by God's grace to those who have faith in the propitiatory sacrifice of Christ (23–31). After showing that the same principle was in force in the times of Abraham and of David (iv.), he enumerates some of the blessings which faith brings in its train: as, peace (v. 1), patience, experience, hope, and eternal life (2–21). Nor does the doctrine of free grace encourage its recipients to carelessness of moral practice. Paul and other believers are dead to sin, and are spiritual men continually in conflict with it (vi., vii., viii. 1–15). Led by the Spirit of God, admitted to the privileges of sonship, aided in prayer by the Spirit of God, they shall never be separated from the love of Christ, and through him shall be more than conquerors (16–39). The doctrine of the Divine sovereignty is next treated of with respect to nations and individuals, passionate desire being expressed for the salvation, ultimately to take place, of the Jewish people (ix.–xi.). Then follow practical exhortations with respect to Christian conduct in the several relations of life—as to friends, to enemies and persecutors, to the Roman civil authorities, to the church in general, and to weaker brethren in particular (xii.–xv. 13). After intimating more minutely than before his own intended movements (14–33), and sending many salutations from himself and his companions (xvi. 1–23.), he closes with a benediction (24–27). No eminent critic has disputed the genuineness of the epistle, which is acknowledged even by Baur. It is first alluded to by Clement of Rome, A.D. 95, by Ignatius, by Polycarp, by various Gnostics, by Justin Martyr, by the writer of the epistle to Diognetus, &c., till finally Irenæus, about 185, refers to it by name. [Pauline Theology.]

Roman-alum, *s.* An alum extracted from the volcanic rocks of the solfaterra near Naples, and containing more alumina than the common alum.

Roman-architecture, *s.*

Arch.: The Composite order. During the first centuries of the Roman state the buildings erected are to be ascribed to the Etruscans, Etruscan art forming the basis of Roman architecture; subsequently, in the time of the Scipios, the taste for Grecian art was mingled with it. Greek architects were soon introduced into Italy; and thus Roman architecture, like Roman art in general, conformed as nearly to the Grecian as the Roman genius permitted it to do. The reticulated masonry [Opus-reticulatum] is peculiar to Roman architecture. It consists of square cuneiform stones or tiles, with the broad ends facing outwards, and arranged in lines, which do not run horizontally, but intersect each other like

net-work. The base and the corners of these walls consist of horizontal layers of square-stone, and there are sometimes intersecting belts of the same kind of material in the middle of the network itself. Amongst all the forms which the Romans borrowed from foreign sources, the art of vaulting, which they learnt from the Etruscans, was that which they most skilfully adapted and developed, and rendered the most distinctive expression of the peculiarity of their own style. Two modes of construction consequently appear side by side in Roman architecture, viz., the Italian arch and the Grecian column.

Roman Catholic, *a. & s.*

A. *As adj.:* Of or belonging to the Roman Catholics. [B.]

B. *As substantive:*

1. *Church Hist.* (*Pl.*): The adherents of the Church which is Roman in its centre and catholic in its circumference. The word Catholic, meaning Universal, was used in early Christian and mediæval times for the great ecclesiastical organization with which the vast mass of Christians were connected. When the Reformation took place, the Protestants refused to admit that the Church which they had left was entitled to call itself Catholic, and prefixed the adjective Roman, whilst its adherents claimed the designation Catholic without any limiting adjective. All admit it to be catholic in the sense of being the largest Church in Christendom, and all other episcopal Churches acknowledge the validity of the orders of its clergy. The number of Roman Catholics in the world has been estimated at 152,000,000, which is far too low; at 213,518,063, at 214,370,000, and at 218,000,000. Taking the second of these estimates, the distribution of Roman Catholics over the world is believed to be: in Europe, 150,684,050; Asia, 8,311,800; Africa, 2,656,205; America, 51,422,566; Australia and the adjacent islands, 443,442, making a total of 213,518,063.

The radical difference between Protestants and Roman Catholics lies in their conception of the Church. The latter hold that the Roman Church is *the* Church of the New Testament, with authority to define articles of faith, and that all bodies not in communion with her are either heretical or schismatic. Protestants' views differ widely—from that of the High Churchman who, while denying the universal jurisdiction of the Pope, admits that as Bishop of Rome he is *primus inter pares*, to that which considers him the Man of Sin and the Antichrist of Scripture. From this fundamental difference all others necessarily follow. Roman Catholics hold the Apostles', the Nicene, and the Athanasian Creeds, Transubstantiation and the sacrifice of the Mass (q.v.), Seven Sacraments [SACRAMENT, *s.*, II. 2.], the necessity of Confession [PENANCE], the existence of a Purgatory (q.v.), the Immaculate Conception of the Virgin Mary, and the Infallibility of the Pope.

Roman-law, *s.* The Civil law; the system of jurisprudence of the ancient Roman Empire.

¶ Roman law, like every other law, originated in custom. Its first great stage of development was reached in the publication by the Decemviri of the Twelve Tables, B.C. 451. These were supplemented rather than superseded under the republic and the empire. Under the former, enactments made in the *Comitia Centuriata* and the *Comitia Tributa*, the *Senatus Consulta*, and the Magisterial Edicts, and, under the latter, the *Imperial Constitutiones* had the force of law. Finally the Justinian Code, A.D. 529, gave symmetry to the whole. The Roman law has more or less affected the legislation of all European countries.

Roman-literature, *s.*

Literature: For nearly 500 years from the accepted date of the foundation of Rome its people had no literature, and when at length they attempted to supply the great want, they wrote in Greek, and in a servile manner followed Greek models. Ennius, who was born B.C. 249, laid the foundation of a genuine Latin literature. It gradually developed, culminating in the Augustan age. Cicero flourished B.C. 60; Cæsar, 54; Cornelius Nepos, 44; Virgil and Horace, 28; Livy and Ovid, 14. About A.D. 180 the Roman literature began to decline, and by 539 it was in the last stage of decay.

1. *Ornith.: Corvus frugilegus*, an eminently gregarious bird, inhabiting cultivated wooded districts, and apparently preferring to build and breed near the abodes of man. They are very widely distributed, and are probably nowhere more common than in England, Ireland, and the south of Scotland. The adult male is from eighteen to twenty-two inches long; plumage black, glossed with purple on the upper parts, lower surface of wing- and tail-quills lustrous, dark grayish-black; legs, toes, and claws black. Base of beak, forehead, lores, chin, and throat bare, but the cause of this nudity is not known. Some assert that the feathers are abraded as the bird digs in the ground for food; others, that it is a natural peculiarity. The female is rather less than the male, and her plumage is not so brilliant. White and other varieties often occur. Their nest is about two feet in diameter; eggs four to six in number, bluish-green, blotched with brown. (See extract.)

3. *Bot.:* The radix or descending axis of a plant. The tendency downwards is very powerful. Unlike the symmetrically placed branches of the stem, the ramifications of the roots look irregular as if they arose from any part of the surface. There is in them, however, a certain Rhizotaxis (q.v.). The roots of Dicotyledons are exorhizal, those of Monocotyledons endorhizal, and those of Acotyledons heterorhizal. A root has no perfect bark, true pith, medullary sheath, or true leaves, and only a thin epidermis, a few stomata, and very rarely leaf-buds. Its growth is chiefly at the lower extremity. The body of a root is called the caudex, its minute subdivisions the fibrils or radicles, and their

ends the spongioles. A primary root is one formed by the downward elongation of the axis of the embryo, and is, therefore, in a line with the stem; secondary or lateral roots, like those of ivy, spring laterally from the stem and from the primary root. When the primary root is thicker than the branches which proceed from it, it is called a tap root, when it is no thicker than its ramifications, which conceal it from view, the root is said to be fibrous. Other forms of roots are conical, fusiform, napiform, rotund, nodose or coralline, moniliform, tuberose, or (finally) premorse. Most roots are terrestrial, a few are aërial, and a few aquatic. The chief functions of the root are to anchor the plant firmly in the ground, and to transmit upwards to the stem and leaves absorbed nutriment from the soil. Roots require air, and in some cases in gardens obtain it by pushing their way into old drains.

Known species about thirty (*Sir Joseph Hooker,* 1870), but Baker (*Journ. of Bot.,* Sept., 1885) enumerates sixty-two species of garden roses, arranging them in ten groups. The wild rose occurs in Europe, Asia, and Africa, and in America throughout the United States and as far south as Mexico. It is of such diversity that former botanists made more than 200 species. These are reduced by some writers to less than a fifth of that number. [ROSE.]

Bot.: Roseworts; an order of plants placed by Lindley under his Rosal Alliance. Calyx four or five-lobed, free or adhering to the ovary; petals five, perigynous, equal; stamens indefinite, rising from the calyx just within the petals, curving inward in æstivation; ovaries several or only one; ovules two or more, generally suspended; fruit either one-seeded nuts or acini, or several-seeded follicles; the leaves are simple or compound, generally with two stipules. Herbaceous plants or shrubs. The Rosaceæ are closely akin to the Pomaceæ, the Drupaceæ, the Sanguisorbeæ, and some other orders. They are divided by Lindley into five families or tribes, Rosidæ, Potentillidæ, Spiræidæ, Quillaiæ, and Neuradeæ. The Rosaceæ occur chiefly in the temperate and cold parts of the northern hemisphere; when they occur in the tropics it is generally on high land. There is no unwholesome plant in the order. They are in general astringent, and have been regarded as febrifuges. [For details, see Agrimonia, Brayera, Fragaria, Geum, Gillenia, Potentilla, Rosa, Rubus, Spiræa, and Tormentilla.] In 1846 Lindley enumerated thirty-eight genera and estimated the known species at 500. Sir Joseph Hooker, in 1870, considered the genera to be seventy-one and the species 1,000, but he includes Lindley's Pomaceæ and Drupaceæ.

A red dye, occurring in commerce under the uames aniline red, azaleine, fuchsine, magenta, roseine, &c. It is prepared by heating a mixture of dry arsenic acid and aniline to 140°, for six or eight hours. It forms colourless crystalline plates, which are coloured red on exposure to the air, insoluble in water, but soluble in alcohol. The aniline reds used in dyeing are generally monoacid salts of rosaniline more or less pure. Rosaniline acetate, $C_{20}H_{19}N_3{\cdot}C_2H_4O_2$, chiefly used in England, forms beautiful large crystals, which are more soluble in water than the other salts. Rosaniline hydrochloride, $C_{20}H_{19}N_3{\cdot}HCl$, prepared in France and Germany, crystallizes in golden-green rhombic octahedra, and is very soluble in alcohol, with a fine red colour.

II. *Technically:*

1. *Compar. Relig.:* A string of beads by means of which account is kept of the number of prayers uttered. Tylor (*loc. inf. cit.*) thinks that its invention or adoption was due to the fact that, with advancing civilization, prayers, from being at first utterances as free and flexible as requests to a living patriarch or chief, stiffened into traditional formulas, whose repetition required verbal accuracy, and whose nature practically assimilated more or less to that of charms.

"This devotional calculating-machine is of Asiatic invention; it had, if not its origin, at least its special development among the ancient Buddhists, and its 108 balls still slide through the modern Buddhist's hands as of old, measuring out the sacred formulas whose reiteration occupies so large a fraction of a pious life. It was not till towards the middle ages that the *rosary* passed into Mohammedan and Christian lands, and finding there conceptions of prayer which it was suited to accompany, has flourished ever since."—*Tylor: Prim. Cult.* (ed. 1873), ii. 372.

2. *Roman Church:*

(1) A form of prayer in which the *Hail Mary* (q.v.) is recited 150 times in honour of the Virgin Mary. It is divided into fifteen decades, each of which begins with the *Our Father* [LORD'S PRAYER], is accompanied by meditation on one of the Mysteries in the life of Our Lord, and ends with the Doxology. This is properly called the Dominican, or Great Rosary, but the name is often popularly given to the Chaplet, which contains but fifty Aves. The fifteen Mysteries which should be meditated on during the recitation of the Rosary are divided into three series, each corresponding to a chaplet:

1. JOYFUL.—The Annunciation, The Visitation, The Birth of Jesus, The Presentation in the Temple, The Finding in the Temple.
2. SORROWFUL.—The Agony in the Garden, the Scourging at the Pillar, the Crowning with Thorns, the Carrying of the Cross, the Crucifixion.
3. GLORIOUS.—The Resurrection, the Ascension, the Descent of the Holy Ghost, the Assumption, and the Coronation of the B. V. M.

Found intimately associated with native gold in California.

2. *Botany:*

(1) The common English name of the genus Rosa (q.v.). The ordinary dog-rose or brier-rose (*R. canina*) is very common; the trailing dog-rose (*R. arvensis*) much less so. It is sometimes confounded with the Ayrshire rose [see below], which is not wild. The true sweet-brier (*R. rubiginosa*) and the small-flowered sweet-brier are found chiefly in the south of England, especially on chalk. The villous rose (*R. villosa*) is widely distributed, whilst the burnet-leaved or Scotch rose (*R. spinosissima*) flourishes best near the sea. Among the garden-species may be mentioned the Ayrshire rose (*R. capreolata*) [see above]; the Bourbon rose, a var. of *R. indica*; the cabbage-rose (*R. centifolia*), the Chinese rose (*R. indica*) [see No. 2]; the Damask rose (*R. damascena*), the fairy-rose (*R. From these the numerous varieties of florists' roses are derived. The petals of *R. damascena* yield attar of roses when distilled. The fruit of *R. canina* and some other species is astringent, and may be used in cases of diarrhœa and similar complaints. The leaves of *R. rubiginosa* have been used as a substitute for tea.

A. *As adj.:* Of, or belonging to Rosenkrenz or the society which he is said to have founded.

B. *As subst.* (*Pl.*): A mystic secret society which became known to the public early in the seventeenth century, and was alleged to have been founded by a German noble called Christian Rosenkreuz, A.D. 1388. He was said to have died at the age of 106. The society consisted of adepts, who perpetuated it by initiating other adepts. It did not interfere with religion or politics, but sought after true philosophy. The Rosicrucians pretended to be able to transmute metals, to prolong life, and to know what was passing in distant places. Many contradictory hypotheses have been brought forward regarding the Rosicrucians, and as it is admitted that their secret was never revealed, it is open to doubt if there was one to reveal. They are said to have died out in the eighteenth century. The writer of the article "Rosicrucians" in the *Encyclopædia Britannica* (ed. 9th) believes that the Rosicrucian Society never existed, and that the persons making it known did so simply for a jest. As, however, the public believed in its existence, individuals from time to time declared that they belonged to it Called also Brothers of the Rosy Cross.

There is no connection with the Latin *rosmarinus* [ROSEMARY]. The confusion seems to have arisen from a passage in Olaus Magnus (ed. 1558, Antv.) "ut rorulento dulcis aquæ gramine vescantur." This appears in a German edition of 1567 (where the animal is called Rossmar) as "dem süssen grasz." Gesner has simply "gramine pascitur." He notes that Germans living on the seaboard call it *rostinger*, that in Moscovy or Scythian Hungary, not far from the source of the Tanais, it is called *morsz*; and that some believe the Mod. Lat. *rosmarus* to be formed from a (M.H.) Ger. *rusóz*, "which seems to have been coined to express the impetus and rushing sound with which the animal moves through the water."]

II. *Technically:*

1. *Agric.:* [¶ (4)].

2. *Astron.:* The turning of a planet round on its imaginary axis, like that of a wheel on its axle. In the infancy of astronomy it was assumed that the earth was at rest, and that the sun and stars moved round it from east to west. After note had been taken of the fact that when a boat is gently gliding along a canal or tranquil lake, the sensation to one on board is as if the boat were stationary, and objects on the bank moved past in the opposite direction, a second hypothesis became worth consideration, viz., that the apparently stationary earth might be like the moving boat, and the heavens resemble the really stationary banks. It gathered strength when it was considered that the earth was not a sphere but an oblate spheroid, as if rapid whirling had bulged it out at the equator, that Jupiter was yet more flattened at the poles than the earth, and that the direction of the trade-winds, cyclones, &c., seemed the result of rotation. In 1851 Foucault completed the proof by making visible to the eye that a pendulum with a very long string alters its direction in a way which cannot be accounted for except by rotation. [GYROSCOPE.] The rotation of the earth is performed with a uniform motion from west to east, and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point again. The only motions which interfere with its regularity are the Precession of the Equinoxes and Nutation (q.v.). The time taken for rotation of the earth measures the length of its day (q.v.). So with the other planets. The sun also rotates as is shown by the movement of spots across its disc. [SUN.] The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir Wm. Thomson, reasoning from some small anomalies in the moon's motion, inferred that ten millions of years ago the earth rotated one-seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49.

¶ (1) *Angular velocity of rotation:* [ANGULAR-VELOCITY].

(2) *Axis of rotation:* [AXIS].

(3) *Centre of spontaneous rotation:* [CENTRE, ¶ (35)].

(4) *Rotation of crops:*

Agric.: The cultivation of a different kind of crop each year, for a certain period, to prevent the exhaustion of the soil. If a plant requiring specially alkaline nutriment be planted year after year in the same field or bed, it will ultimately exhaust all the alkalis in the soil and then languish. But if a plant be substituted in large measure requiring siliceous elements for its growth, it can flourish where its alkaline predecessor is starved. Meanwhile the action of the atmosphere is continually reducing to a soluble condition small quantities of soil, thus restoring the lost alkalis. Manure will replace lost elements more quickly. The period of rotation is often made four years. [FOURCOURSE.] By the neglect of rotation soils in parts of Sicily, Asia Minor, Campania, and Spain, which were once highly productive, are now barren.

Zool.: Wheel-animalcules; a group of Metazoa, which have been variously classified. Ehrenberg arranged them according to the peculiarities of their trochal discs, and Dujardin according to their methods of locomotion. They are now often made a class of Vermes, with four families, Philodinidæ, Brachionidæ, Hydatineæ, and Flosculariadæ. They are microscopic animals, contractile, crowned with vibratile cilia at the anterior part of the body, which, by their motion, often resemble a wheel revolving rapidly. Intestine distinct, terminated at one extremity by a mouth, at the other by an anus; generation oviparous, sometimes viviparous. [SUMMER-EGGS.] The nervous system is represented by a relatively large single ganglion, with one or two eye-spots, on one side of the body, near the mouth, and there are organs which appear to be sensory. They are free or adherent, but never absolutely fixed animals.

Wilkins and Wallis, established a scientific club in the metropolis, which maintained a chequered and intermittent existence sometimes in London at others in Oxford, till at length being revived at the Restoration it became the parent of the Royal Society. At a meeting of the club, held Nov. 28, 1660, the formation of a new society was resolved on, and its scope and constitution defined. Its first public action took place on Dec. 5, 1660, and the members, in 1662, obtained a charter, and were incorporated as the Royal Society. Charles II. flattered himself that he was its founder, and among the names of its fellows was that of the Duke of York, afterwards James II. Sir Isaac Newton was elected a fellow in Jan., 1672, admitted in Feb., 1672, and in 1703 became president. The first number of the *Philosophical Transactions*, recording the work of the society, appeared on March 6, 1665. After 1800 the annual volume took the place of occasional numbers. In 1709, a bequest from Sir Godfrey Copley led to the establishment of the Copley gold medal, and a donation from Count Rumford, in 1796, resulted in the foundation of the Rumford gold and silver medals. Two more medals were established by George IV. in 1825. The Linnæan Society branched off from it in 1788, the Geological Society in 1807, and the Royal Astronomical Society in 1820. For a considerable time the number of the members stood at 600; latterly, however, only fifteen members have been annually elected, so that the number of fellows will in a few years be reduced below 500. With the exception of a small Roman Academy, the Royal Society of London was the first of the kind established, the Royal Academy of Science at Paris not having arisen till 1666.

It is a dry, brittle, amorphous mass, resembling dried varnish, and of a deep yellow colour in thin layers, very soluble in water, less soluble in alcohol, and insoluble in ether. Rû-bĭ-cŏn, *s.* [Lat.] A small stream of Italy, falling into the Adriatic to the north of Ariminum. It formed in part the northern boundary of *Italia Propria*, and on this account the Roman generals were forbidden to pass the Rubicon with an armed force, under dreadful imprecations, and to do so was considered equivalent to a declaration of war. According to the story, Cæsar crossed the

Rubicon with his army at the breaking out of the civil war with Pompey, exclaiming, "The die is cast!" Hence the phrase, *To cross* (or *pass*) *the Rubicon* = to take a decisive step in any enterprise. The position of the Rubicon has not been clearly ascertained; some identify it with Fiumesimo, some with Lusa, and others with Pisatello.

It is a colourless liquid of oily consistence and faint odour, slightly soluble in water, freely in alcohol and ether, has a sp. gr. of 1·017, and boils at 230°. Its salts have a tendency to assume a reddish tint on exposure to the air.

rû-bĭd′-ĭ-ŭm, *s.* [Lat. *rubidus* = dark red.]

Chem.: A monad metallic element belonging to the potassium group, discovered by Kirchhoff and Bunsen in 1860. Symbol Rb; atomic weight, 85·4; sp. gr. 1·52. It has been detected in mineral waters, in several lepidolites, and in the ash of many plants, as tobacco, tea, and coffee. It may be obtained from the saline residue in the preparation of lithia from lepidolites, by adding platinic chloride, and dissolving out the potassium compound by repeated boiling with water. The chloroplatinate of rubidium is reduced with hydrogen, and the purified chloride of rubidium, mixed with calcium tartrate and soot, is heated in a furnace, the volatilised metal being collected in a receiver containing mineral naphtha. It is a white metal with silvery lustre, soft to the touch, and melting at 38·5°. Exposed to the air, it becomes covered with a gray film, and soon takes fire. When thrown on water it takes fire even more readily than potassium, and burns with a flame like the latter.

It is rather larger than a snipe; general plumage ash-brown, spotted, or mottled with black, but no two specimens are alike. In the breeding season the neck is surrounded by a frill or ruff of numerous long black feathers, glossed with purple, and barred with chestnut. Whilst probably serving primarily as an attraction to the hen-birds, this frill acts also as a shield, for the polygamous Ruffs are lutensely pugnacious, and furious battles take place between them for the possession of the females, which are called Reevcs, and are more uniform in coloration, and smaller than the males. The nest is usually of coarse grass, in a moist swampy place, the eggs four in number. Large numbers are caught and fattened in Holland, and sent to England, where they are rapidly becoming rare, owing to the destruction of their favourite haunts, the fens, by drainage.

All the monastic *rules* require to be approved of by the ecclesiastical superiors, and even by the Holy See, to impose an obligation of conscience on religious. When a religious cannot bear the austerity of his *rule*, he is obliged to demand a dispensation from his superiors, or permission from the Holy See to enter a more mitigated order."—*J. N. The commonest form is that used by carpenters, joiners, and other artificers. It is divided into inches and fractions, and is usually jointed, so that it may be folded up and carried in the pocket. Some rules have a slider in one leg; in Gunter's scale this is graduated and engraved with figures, so that various simple computations may be made mechanically.

Formerly, each court of common law issued its own general rules, without much regard to the practice in other courts; but of late the object has been to assimilate the practice in all the courts of common law. The rules are a declaration of what the court will do, or will require to be done, in all matters falling within the terms of the rule, and they resemble in some respects the Roman edict. *Particular rules* are such as are confined to the particular cases in reference to which they have been granted.

rŭm, *s.* [See extract.]

Comm. : A spirit distilled chiefly in the West Indies from the fermented skimmings of the sugar-boilers and molasses, together with sufficient cane juice to impart the necessary flavor. Like all other spirit, it is colorless as it issues from the still, but to suit the taste of the consumer, the distiller is obliged to color it before it leaves his premises. Its strength as imported is usually about 20 per cent. over proof, but before passing into the hands of the consumer it is reduced with water. Rum sold below 35 per cent. under proof is considered to be adulterated with water, unless the purchaser is informed of its exact strength at the time of purchase. Much of the rum sold in this country is merely plain spirit, colored with burnt sugar, and flavored with rum flavoring. Rum was formerly largely imported from the West Indies.

"Mr. N. Darnell Davis has put forth a derivation of the word *rum*, which gives the only probable history of it. It came from Barbadoes, where the planters first distilled it, somewhere between 1640 and 1645. A MS. *Description of Barbadoes*, in Trinity College, Dublin, written about 1651, says: 'The chief fuddling they make in the Island is *rumbullion*, alias Kill-Divil, and this is made of sugar canes distilled, a hot, hellish, and terrible liquor.' G. Warren's *Description of Surinam*, 1661, shows the word in its present short form: '*Rum* is a spirit extracted from the juice of sugar-canes, ... called Kill-Devil in New England.' '*Rumbullion*' is a Devonshire word, meaning 'a great tumult,' and may have been adopted from some of the Devonshire settlers in Barbadoes; at any rate, little doubt can exist that it has given rise to our word *rum*, and the longer name *rumbowling*, which sailors give to their grog."—*Academy*, Sept. 5, 1885, p. 155.

1. *Lit. & Animal Physiol.:* The act of chewing the cud. The food of the ruminants is grass, which requires a longer series of chemical changes to convert a portion of it into blood, than does the flesh of other animals eaten by the Carnivora. To produce these changes there is a complex stomach divided into four parts, the Rumex or Paunch, the Reticulum or Honeycomb Bag, the Psalterium or Manyplies, and the Abomasum or Reed. A ruminant does not chew the fodder which it eats, but simply swallows it. When it has had enough it retires to a quiet spot, forces up again to the mouth a portion of the food in its paunch, thoroughly chews it and then swallows it again. Another and another bolus is thus disposed of. Each of these, started from the paunch, was forced next into the honeycomb bag where it received its form and then went up the gullet. On returning it passed direct from the paunch into the manyplies or third stomach, and then to the abomasum.

Archæology:

1. Any letter of the Futhork (q.v.). They are formed almost entirely of straight lines, and may have been derived, as Schlegel supposes, from the Phœnicians, for several of the Runic characters bear close resemblance to the letters of the Phœnician alphabet. Schloezer holds that they are corruptions of the Roman alphabet, whilst another theory is that they are the original characters of the Indo-Germanic tribes brought from the East, and preserved among the races of that stock. The name Rune was first mentioned by Venantius Fortunatus in the sixth century as the name of a German letter. The knowledge of the Runes was confined to a small class, and they were used for purposes of augury, and for magical symbols. They have been grouped into three systems—the Anglo-Saxon, the German, and the Norse or Scandinavian; but no great difference exists between them. Traces of Runes in inscriptions occur in England in the old kingdoms of Northumbria, Mercia, and East Anglia; in Denmark, Norway, Sweden, Germany, and Iceland. The so-called Runes of North America are nothing more than Indian picture-writing.

In 1875 the Madras or Company's rupee of 16 annas, or 192 pice, was valued at 1s. 10½d., and the Sicca rupee = 1$\frac{1}{15}$ of the Company's rupee, 1s. 11$\frac{3}{4}$d. Next year (1876) the appreciation of gold began or became perceptiblo with the corresponding depreciation of silver. Tested by a gold standard the Madras rupee steadily fell, and in 1886 was worth about 1s. 6d. only. As the Indian government receiving taxes in silver, has to pay home charges in gold or its full equivalent, it lost, in 1876-7, a little over two millions of pounds sterling, and in 1882-3 more than three millions. (*W. W. Hunter: Indian Empire, Statesman's Year Book, &c.*)

¶ *The Book of Ruth:*

Old Test. Canon: A short book now placed in the Hebrew Bible in the Hagiographa, between the Song of Solomon and the Lamentations. The English Bible, following the Septuagint and the Vulgate, arranges it between the books of Judges and Samuel. During the times of the Judges, a certain Elimelech, of Bethlehem-Judah, *i.e.*, of Bethlehem in Judah, as distinguished from Beth-le-hem in Zebulun (Josh. xix. 15), to escape a famine then raging, went to Moab with his wife, Naomi, and his two sons, Mahlon and Chilion, who married two Moabitesses, Orpah and Ruth. There all the male members of the family died, and the widowed Naomi, hearing that the famine was over, thought of returning home. Orpah, after starting with her, was prevailed on to return; Ruth, the heroine of the narrative, could not be persuaded to go back, and having, after reaching Bethlehem, gone into the fields as a gleaner, she attracted the notice of Boaz, an aged kinsman, with whom she made a romantic marriage, ultimately becoming the great-grandmother of King David, and an ancestress of Jesus Christ (Matt. i. 5). The Book of Ruth is a beautiful idyllic composition. It was penned not earlier than the time of David (ch. iv. 22), and probably much later, for there had been time for customs existent in the days of Boaz and Ruth to change (7). The narrative is in pure Hebrew, but there are Aramæanisms in the dialogues. Most critics place its composition before, but Ewald during, the Exile. Its canonicity has never been doubted.

"The *Ruthenians* have a married secular clergy, and religious who follow the Rule of St. Basil. The Bishops are usually taken from the monks."—*Addis & Arnold: Cath. Dict.*, p. 730.

rû-thēn'-ĭc, *a.* [Eng. *ruthen(ium); -ic.*] Derived from ruthenium (q.v.).

ruthenic-acid, *s.* [RUTHENIUM-OXIDES (4).]

rû-thē'-nĭ-ŭm, *s.* [See extract.]

"In 1828 Osann stated that he had discovered three new metals in the platinum ores from the Ural. To one of these he gave the name of *ruthenium*, from the name of Russia."—*H. E. Roscoe: Treat. on Chemistry*, ii. (pt. ii.), 449.

Chem.: A tetrad metallic element discovered by Osann in 1828, and first isolated by Claus in 1846. Symbol, Ru. Atomic weight 104. It occurs in platinum ores, chiefly in osmiridium, and is separated from the latter by heating to redness a mixture of this ore and common salt in a current of moist chlorine. By digestion in cold water an extract is obtained from which ammonia throws down the oxides of ruthenium and osmium. The latter is expelled by heat, and the former converted into ruthenate of potassium by fusion with potash, which yields oxide of ruthenium on addition of nitric acid. On ignition in a stream of hydrogen the oxide is reduced to the metallic state in the form of porous fragments. With the exception of osmium it is the most refractory of all metals, but can be fused in the hottest part of the oxyhydrogen blow-pipe. It then has a density of 11 to 11·4, and is scarcely attacked by nitro-muriatic acid.

ruthenium-chlorides, *s. pl.*

Chem.: Ruthenium forms three chlorides: (1) Dichloride, $RuCl_2$; produced when powdered ruthenium is ignited in a stream of chlorine. It remains as a black crystalline powder, insoluble in water and in all acids. (2) Trichloride, $RuCl_3$; prepared by dissolving in hydrochloric acid the black precipitate obtained from ruthenate of potassium by addition of an acid. It is a yellow-brown crystalline mass, easily soluble in water and alcohol. With sulphocyanide of the alkalis it yields a red coloration, changing to deep violet on heating. (3) Tetrachloride, $RuCl_4$; known only in combination in its double salts, *e.g.*, K_2RuCl_6, which crystallizes in regular transparent octahedrons.

ruthenium-oxides, *s. pl.*

Chem.: Ruthenium forms five oxides: (1) Protoxide, RuO, obtained by calcination of the dichloride, has a dark-gray colour, and is not acted on by acids. (2) Sesquioxide, or ruthenious oxide, Ru_2O_3, produced when pulverised ruthenium is heated in contact with the air, has a deep blue colour, and is insoluble in acids. (3) Dioxide, or ruthenic oxide, RuO_2, formed by roasting the disulphide. It is a black-blue powder with a tinge of green. (4) Trioxide, RuO_3, commonly called ruthenic acid, is known in combination with potash, and is produced when ruthenium is fused with potash and nitrate of potassium. (5) Tetroxide, RuO_4, produced by passing chlorine into a solution of the fused mass obtained by heating ruthenium with potash and nitre. This volatile oxide passes over and condenses on the neck of the retort. It is golden-yellow and crystalline, volatilizes at ordinary temperatures, melts at 58°, boils at 100°, and is heavier than sulphuric acid. Is sparingly soluble in water.

S.

S, the nineteenth letter and the fifteenth consonant of the English Alphabet, represents a hissing sound, and is classed as a sibilant. "In pronouncing *s*, we touch the gum with a part of the tongue just above that part which is used in pronouncing the palatals; but we touch the gum so lightly, and with the tongue so broadened out that we do not stop the outward flow of the breath completely: it oozes forth with that hissing sound which, whether in the human organ or in any other machine, invariably results from the rapid flow of air through a contracted passage." (*Beames: Comp. Gram. Aryan Lang.* (ed. 1872), i. 217). There are two sounds attached to this letter in English; the one surd, or uttered with breath merely, the other sonant or voiced. The first is a mere hissing sound, as in *sin, so,* &c.; the other is exactly the same as that of *z*, as in *music, muse,* &c. *S* in some words, as *isle, island, viscount,* is silent. It is closely allied to *r*, and even in the oldest English we have traces of the interchange, as in *frore* = *froren* = *frosen* (*frozen*), *gecoren* = *chosen,* &c. *S* has become *st* in *hoist* = *hoise, whilst* = *whiles,* &c. It has been changed into *c*, as in *mice* = O. Eng. *mys, once* = O. Eng. *ones, hence* = O. Eng. *hennes,* &c. With a following *h* it forms a digraph, a weakening of an older and stronger sound *sc*, as *shall* = O. Eng. *sceal, fish* = O. Eng. *fisc,* &c. It has been changed into *ge*, as in *cabbage* = Fr. *cabus;* Lat. *cabusia: sausage* = Fr. *saucisse;* Lat. *salsisia.* In *pickaxe,* owing to a mistaken etymology, it has become *x*. In Romance words *s* has passed into *sh*, as *radish* = Lat. *radix; cash* = Fr. *casse, chasse* = Lat. *capsa.* From some words it has disappeared as in *pea* = O. Eng. *pise* = Lat. *pisum; hautboy* = Fr. *hautbois; puny* = Fr. *puisne,* &c. In a few words we find an intruded *s*, as in *island* = O. Eng. *ealand, igland, aisle* = Fr. *aile; squeeze, sneeze, scratch, smelt,* &c. It is represented by *z* in *dizzy* = O. Eng. *dysig; freeze* = O. Eng. *freosan.* In O. Eng. *sc* and *sp* were frequently transposed to *cs* and *ps*, as in *ask* = O. Eng. *axian, clasped* = *clapsed. S* is an exceedingly common letter in English. It is the characteristic sign of the genitive case and plurals of nouns.

S. As an initial is used for South, as in S.W. = South-West; for Society, as F.R.S. = Fellow of the Royal Society; for Saint, or double (SS.) for Saints.

S. As a symbol is used:

1. As a numeral for 7, and with a dash over it, $\bar{S}$, for 7,000.

2. In chemistry for the element Sulphur.

săb′-ạ-trīne, *s.* [Formed from *sabadilla* (q.v.), on analogy of *veratrine.*]

Chem.: $C_{51}H_{88}N_2O_{17}$. An alkaloid discovered by Weigelin in sabadilla seeds. It forms an uncrystallizable resin-like mass, slightly soluble in water, soluble in alcohol, ether, chloroform, and benzol, and neutralizes acids forming salts.

B. *As substantive:*

* 1. In the sixteenth century, one who considered that the Christian Sabbath should be kept on the seventh day (Saturday). [SEVENTH-DAY BAPTISTS.]

"This term designates a very small sect in the 17th and 18th centuries, who insisted strictly on keeping the seventh day as their Sabbath, according to the letter of the divine injunction. It is only by a modern misuse of the word that a *Sabbatarian* is understood to be one who abjures all work on Sunday."—*Daily Telegraph,* Dec. 19, 1885.

2. One who holds that the Lord's day is to be observed among Christians in exactly the same manner as the Jews were enjoined to keep the Sabbath; one who holds rigid views of Sabbath observance. The *Shorter Catechism* (Q. 60) says:

"The Sabbath is to be sanctified by a holy resting all that day even from such worldly employments and recreations as are lawful on other days; and spending the whole time in the publick and private exercises of God's worship, except so much as is to be taken up in the work of necessity and mercy."

Sabbatarian Controversy, *s.*

Church Hist.: A controversy regarding the manner in which Sunday should be kept, arising out of the publication of King James's *Book of Sports* [SPORT, *s.*], published in 1618, between the High Churchmen, who were generally in favour of the king's views, and the Puritans, who very strongly opposed them. Though the controversy has altered its form, and access to museums, libraries, and picture-galleries is now contended for, it has not yet reached its end.

Săb-bạ-tā′-tī, *s. pl.* [INSABBATATI.]

Săb′-bath, *s.* & *a.* [Heb. שַׁבָּת (*shabbath*) = Sabbath, from שָׁבַת (*shabath*) = to rest.]

A. *As substantive:*

1. *Old Test.:* A sacred day of rest, the institution of which is first mentioned in Gen. ii. 2-3:

"And on the seventh day God finished his work which he had made; and he rested on the seventh day from all his work which he had made. And God blessed the seventh day and hallowed it; because that on it he rested from all his work which God had created and made."—*R. V.*

The prevailing interpretation of these verses is that the Sabbath was instituted at the Creation for mankind in general, and that septenary institutions (q.v.) may therefore be expected in all nations. Prior to the law from Mount Sinai, the Sabbath is mentioned in connection with the descent of manna (Exod. xvi. 5, 22-30). The keeping holy of the Sabbath is enjoined in the fourth commandment in Exodus, because of God's having rested after the Creation (Exod. xx. 8-11); in Deut. because of the deliverance of the Hebrew bondsmen
